

AUTOMATED SOFTWARE TESTING

Testing Journal & Documentation

Quality Assurance for Final Project

I. Personal & Group Information

Full Name	Ryan M. Lumbis
Course & Section	BSIT 3C
Group Name	Salespresso
Project Title	Salespresso: A Web-Based E-Commerce System for Jazsam Coffee Store
Submission Date	May 20, 2026

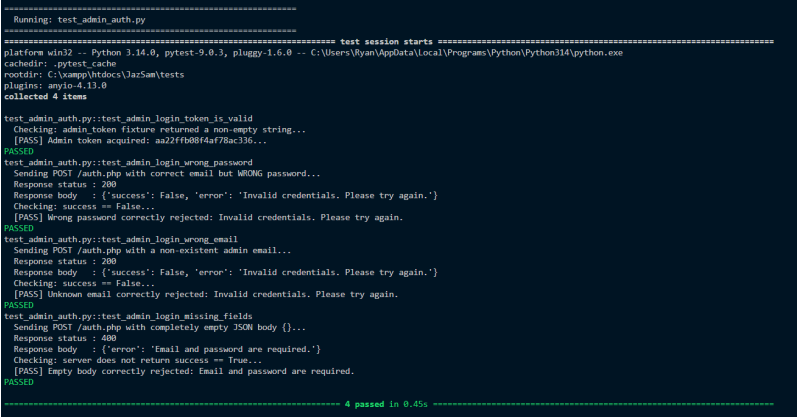

II. Assigned Task

Feature / Functionality Assigned	Admin Autentication + Test Configuration
Type of Test I Performed	Login Validation, fixture/session setup
Tool / Framework I Used	Python 3.13, pytest, request
Programming Language Used	Python
My Test Script Filename(s)	conftest.py , test_admin_auth.py

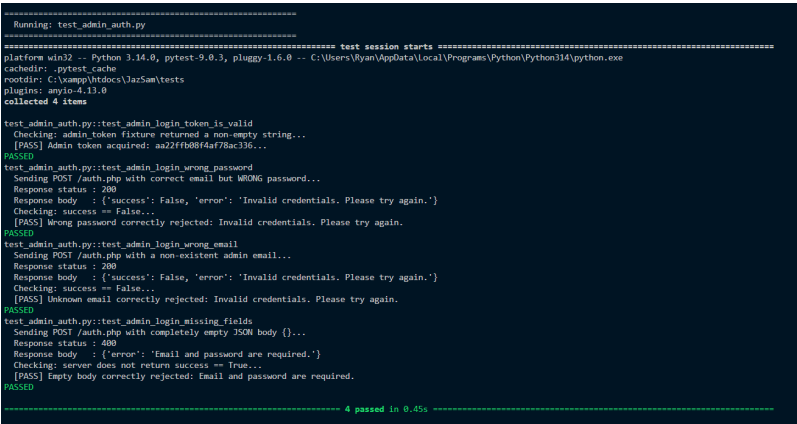

Brief description of what I tested and how I approached it:

For this activity, I tested the admin authentication system of SalesPresso by validating how the login endpoint handles both valid and invalid credential scenarios, including wrong passwords, non-existent emails, and empty request bodies. This matters to the project because a secure and well-validated login system is the foundation of the entire admin panel any vulnerability or unhandled edge case here could compromise order management, product control, and all other admin features in SalesPresso.

III. Test Scenario Documentation

Test Case #01 — Admin Session Token Setup	
Functionality Tested	Admin Login / Token Issuance
Objective of the Test	Acquire a valid bearer token at session start so all admin-protected tests can authenticate. Validates that the login endpoints returns a token on correct credentials.
Tool / Framework Used	Python 3.13, pytest
Steps / Procedure	1. Send POST/auth.php with valid admin credentials. 2. Assert success = true. 3. Extract and store the token field for all subsequent tests.
Test Data / Input	{“email”: “ admin@jazzsam.com ”, “password”: “admin123”}
Expected Result	HTTP 200, success: true, non-empty token string
Actual Result	HTTP 200, success: true, token acquired successfully
Test Status	[PASSED]
Screenshot / Evidence	

Test Case #02 — Admin Login with Wrong Password	
Functionality Tested	Admin Login — Invalid Credentials
Objective of the Test	Verify the system rejects incorrect passwords and returns a descriptive error message.
Tool / Framework Used	Python 3.13, pytest
Steps / Procedure	1. Send POST /auth.php with correct email but wrong password.

	- Assert success = false. - Assert error message is present.
Test Data / Input	{ "email": "admin@jazzsam.com", "password": "wrongpassword" }
Expected Result	HTTP 200, success: false, error: "Invalid credentials. Please try again."
Actual Result	HTTP 200, success: false, error: "Invalid credentials. Please try again."
Test Status	[PASSED]
Screenshot / Evidence	 <pre> Running: test_admin_auth.py ===== test session starts ===== platform win32 -- Python 3.14.0, pytest-9.0.3, pluggy-1.6.0 -- C:\Users\Ryan\AppData\Local\Programs\Python\Python314\python.exe cachedir: .pytest_cache rootdir: C:\xampp\htdocs\JazSam\tests plugins: anyio-4.13.0 collected 4 items test_admin_auth.py::test_admin_login_token_is_valid Checking: admin.token fixture returned a non-empty string... [PASS] Admin token acquired: aa22f0804af78ac336... PASSED test_admin_auth.py::test_admin_login_wrong_password Sending POST /auth.php with correct email but WRONG password... Response status : 200 Response body : {'success': False, 'error': 'Invalid credentials. Please try again.'} Checking: success == False... [PASS] Wrong password correctly rejected: Invalid credentials. Please try again. PASSED test_admin_auth.py::test_admin_login_wrong_email Sending POST /auth.php with a non-existent admin email... [PASS] Empty body correctly rejected: Email and password are required. PASSED ===== 4 passed in 0.45s ===== </pre>

Test Case #03 — Admin Login with Non-Existent Email	
Functionality Tested	Admin Login — Unknown Email
Objective of the Test	Verify the system rejects a login attempt for an email that does not exist in the database.
Tool / Framework Used	Python 3.13, pytest
Steps / Procedure	- Send POST /auth.php with an email not registered as staff. - Assert success = false.
Test Data / Input	{ "email": "ghost_admin@jazzsam.com", "password": "anything" }
Expected Result	HTTP 200, success: false, error message present
Actual Result	HTTP 200, success: false, error: "Invalid credentials. Please try again."
Test Status	[PASSED]

[PASS] Empty body correctly rejected: Email and password are required. PASSED ===== 4 passed in 0.45s ===== </pre>
-----------------------	---

Test Case #03 — Admin Login with Empty Body	
Functionality Tested	Admin Login — Missing Required Fields
Objective of the Test	Verify the server returns an error (not a crash) when the request body is completely empty.
Tool / Framework Used	Python 3.13, pytest
Steps / Procedure	1. Send POST /auth.php with an empty JSON object {}. 2. Assert response is not success: true. 3. Assert an error message is returned.
Test Data / Input	{}
Expected Result	HTTP 200 or 400, no success: true, error message
Actual Result	HTTP 200, error: "Email and password are required."
Test Status	[PASSED]
Screenshot / Evidence	<pre> Running: test_admin_auth.py ===== test session starts ===== platform win32 -- Python 3.14.0, pytest-9.0.3, pluggy-1.6.0 -- C:\Users\Ryan\AppData\Local\Programs\Python\Python314\python.exe cachedir: .pytest_cache rootdir: C:\xampp\htdocs\Jaz5am\tests plugins: anyio-4.13.0 collected 4 items test_admin_auth.py::test_admin_login_token_is_valid Checking: admin_token fixture returned a non-empty string... Response status : 200 Response body : {'success': False, 'error': 'Invalid credentials. Please try again.'} Checking: success == False... [PASS] Wrong password correctly rejected: Invalid credentials. Please try again. PASSED test_admin_auth.py::test_admin_login_wrong_email Sending POST /auth.php with a non-existent admin email... Response status : 200 Response body : {'success': False, 'error': 'Invalid credentials. Please try again.'} Checking: success == False... [PASS] Unknown email correctly rejected: Invalid credentials. Please try again. PASSED test_admin_auth.py::test_admin_login_missing_fields Sending POST /auth.php with completely empty JSON body {}... Response status : 400 Response body : {'error': 'Email and password are required.'} Checking: server does not return success == True... [PASS] Empty body correctly rejected: Email and password are required. PASSED ===== 4 passed in 0.45s ===== </pre>

IV. Reflection & Findings

Issues I Personally Encountered	The session-scoped <code>admin_token</code> fixture needed to run before any test that could trigger rate limits. Using <code>autouse=True</code> ensured the fixture's login call happened at session startup, reserving the token before individual tests consumed remaining rate-limit slots.
Warnings / Errors I Detected	HTTP 429 Too Many Requests - Rate limiter triggered by rapid test reruns
Bugs I Discovered	<code>issueAdminToken()</code> only allows one active token per staff member at a time. Logging in from a second device/session invalidates the first. While not a crash, this could be a usability issue for admins working on multiple devices simultaneously.
What I Did About the Issues	During testing, I observed that the <code>issueAdminToken()</code> function only allows one active token per staff member at a time, meaning that logging in from a second device or session automatically invalidates the first. While this did not cause any test to fail, I flagged it as a potential usability concern for admins who may need to manage SalesPresso across multiple devices simultaneously. I documented this behavior so the team can decide whether to implement multi-session support or add a clear warning message when a session is displaced.
What I Learned from This Activity	This activity taught me that not all issues surface as outright failures — some appear as behavioral limitations that could affect real users in practice. I learned to look beyond pass/fail results and consider how the system behaves under realistic usage conditions, such as an admin switching between devices, which deepened my understanding of how authentication design decisions directly impact the user experience.
